

Welcome
Questions at the end

App-V

**How do you
deploy
applications?**

How do you deploy applications?

Many different ways
From GPO push to just installing at time of image
Hope no one is doing local installs

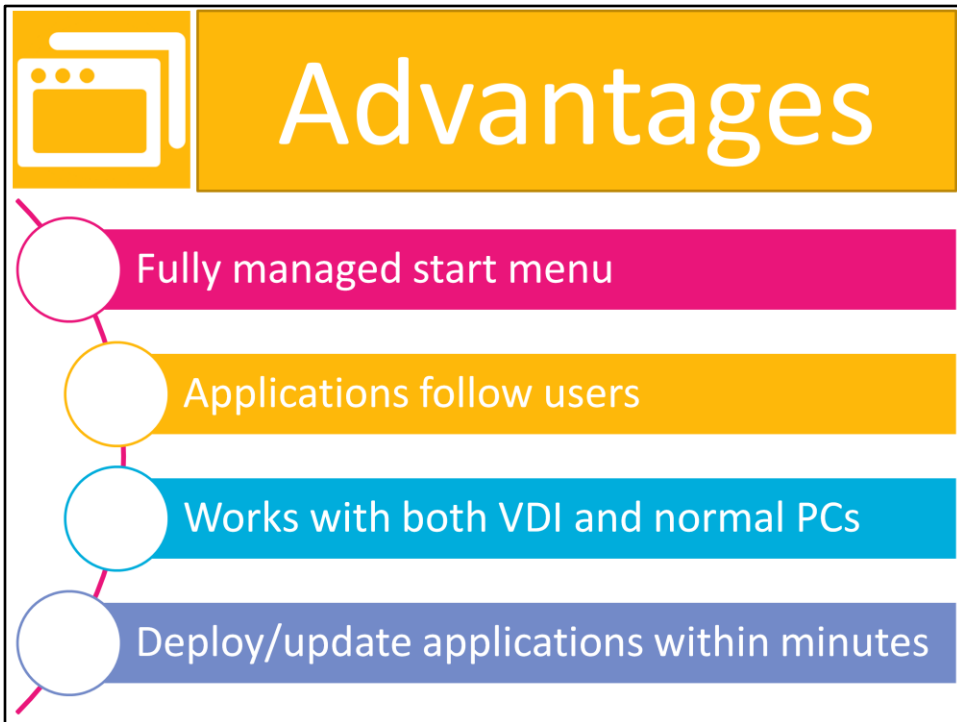

Computer ends up something like
Mess of applications
Conflicts if you try to run multiple versions of programs
Broken install files clogging up the place
Google Earth asking for an update.....AGAIN?
Machine based deployments

Envision a box – with loads of applications limited to that box + sitting inside all running around conflicting with each other

Applications run independently of each other
Virtual so nothing is 'installed' on the PC
No conflicts
Easy to update applications to future versions
User based assignment not machine based
App-V captures the application and runs it inside its own box

Managed start menu
Applications follow users – no restrictions
Works with anything
Easy to update/deploy
